Automated handling systems for products and packaging

A new project by Ilpra arises from its joint-venture with Abrigo, a company boasting 30 years experience in automated handling systems for products and packaging. Two companies working together on tailored end-line robotic automation systems for packaging lines.

Ilpra presents its new range of innovative solutions such as robotized loading systems for products to be packaged, end-line with robot, secondary packaging, and palletizing. Each solution has been studied by Ilpra with the intention of integrating all systems within a single constructive con-

cept as regards materials, compactness and reduction of encumbrance and components used whether they are mechanical, electrical or electronic.

The I-Load island is the automatic loading system for various types of products that come in bulk on a belt by means of a robotic system coupled with a sophis-

ticated vision system that can detect the location, the size of products and also able to throw away possible defects.

Unlike other systems currently on the market, this system loads from a belt placed above (and not laterally) on the packaging line, thus significantly reducing the space required for its installation.

Besides I-Load, it is also possible to create different customized solutions for automatic loading for the specific needs of a product, whether the product is coming in single row, in step sequence or random.
